

Archiver API

The Libraesva Email Archiver exposes a set of Application Programming Interface.

APIs are always available, the list of all available APIs can be found at path **/api/v1/doc** of your Archiver.

Eg.: `demo.archiver.esvacloud.com/api/v1/doc`

You can interact with APIs directly from the documentation page by authenticating with the “Authorize” button at the top right of the page, this authentication will require a valid JWT.

To generate the JWT a login must be performed on the **/api/{version}/login** endpoint, which will return a token (the JWT) and a refresh token, the refresh token can be used to regenerate the JWT after it expires.

To finalize the authentication you must paste the JWT with the keyword “**Bearer**” in front of it and then press “Authorize”, now you are correctly authenticated and can try out any of the listed endpoints.

Example:

Available authorizations x

api_key (apiKey)

Your Json Web Token
Name: Authorization
In: header
Value:

Bearer 43d52cabec01e0xjant

Authorize Close
