Archiver API

The Libraesva Email Archiver exposes a set of Application Programming Interface.

APIs are always available, the list of all available APIs can be found at path **/api/v1/doc** of your Archiver.

Eg.: demo.archiver.esvacloud.com/api/v1/doc

You can interact with APIs directly from the documentation page by authenticating with the "Authorize" button at the top right of the page, this authentication will require a valid JWT.

To generate the JWT a login must be performed on the **"/api/{version}/login"** endpoint, which will return a token (the JWT) and a refresh token, the refresh token can be used to regenerate the JWT after it expires.

To finalize the authentication you must paste the JWT with the keyword "**Bearer**" in front of it and then press "Authorize", now you are correctly authenticated and can try out any of the listed endpoints.

Example:

Once the JWT token expires you can generate a new one using the "Refresh Token" returned from the /login API call, to generate a new JWT POST the refresh token as parameter to the **"/api/{version}/refresh"** endpoint.

This will return a new valid JWT and a new Refresh Token to use for subsequent API calls.
