

# CA Certificate import

## PROBLEM:

I have Libra Esva version 2.5.0.0, how can i import my own web certificate?

## SOLUTION:

Version 2.5.0.3 and above has this feature enabled under menu Settings->Networking and System Settings. For all previous versions, login as root from console:

```
cd /etc/pki/tls/certs
```

```
openssl genrsa -out esva.key 1024
```

```
openssl req -new -key esvakey -out esva.csr
```

Download certificate request esva.csr and send it to the desired CA. Get the certificate. Copy the certificate in /etc/pki/tls/certs

edit file /etc/httpd/conf.d/ssl.conf and adjust variables:

```
SSLCertificateFile
```

```
SSLCertificateKeyFile
```

Restart httpd with service httpd restart
