

# ESVA database corruption

## PROBLEM:

You receive an error in ESVA web interface, or you have recurrent cluster errors.  
*Error executing query: Table 'maillog' is marked as crashed and last (automatic?) repair failed.*

## SOLUTION:

This error can happen when you ran out of disk space in your ESVA VM or after a brute force shutdown of ESVA VM (e.g. power outage).

Since **Libra Esva 3.5** release there is a handy tool to check and recover databases automatically.

×Connect in console (or ssh) with user admin and select option d) Check and Repair DataBase.
