

# Intermediate TLS(SSL) certificates

## **PROBLEM**

We have an intermediate certificate, how can we use it in Libra Esva?

## **SOLUTION**

When you load the certificate file (.crt) through the Esva web interface, just add the whole chain to the file.

This can be done just placing all the certs of the chain in the same file.

Once loaded, you can test your ssl configuration via <https://www.ssllabs.com/ssltest/>
